Abstract

This article is devoted to study the nonlinear Schrödinger-Poisson system with pure power nonlinearities $\begin{aligned} & -\Delta u + u + \phi = |u|^{p-1}u + |u|^4u, \\ & \text{and } x \in \mathbb{R}^3, \end{aligned}$ where $4 < p < 5$. By employing constraint variational method and a variant of the classical deformation lemma, we show the existence of one ground state sign-changing solution with precisely two nodal domains, which complements the recent work of Wang et al. (missing citation).
