

FIGURES

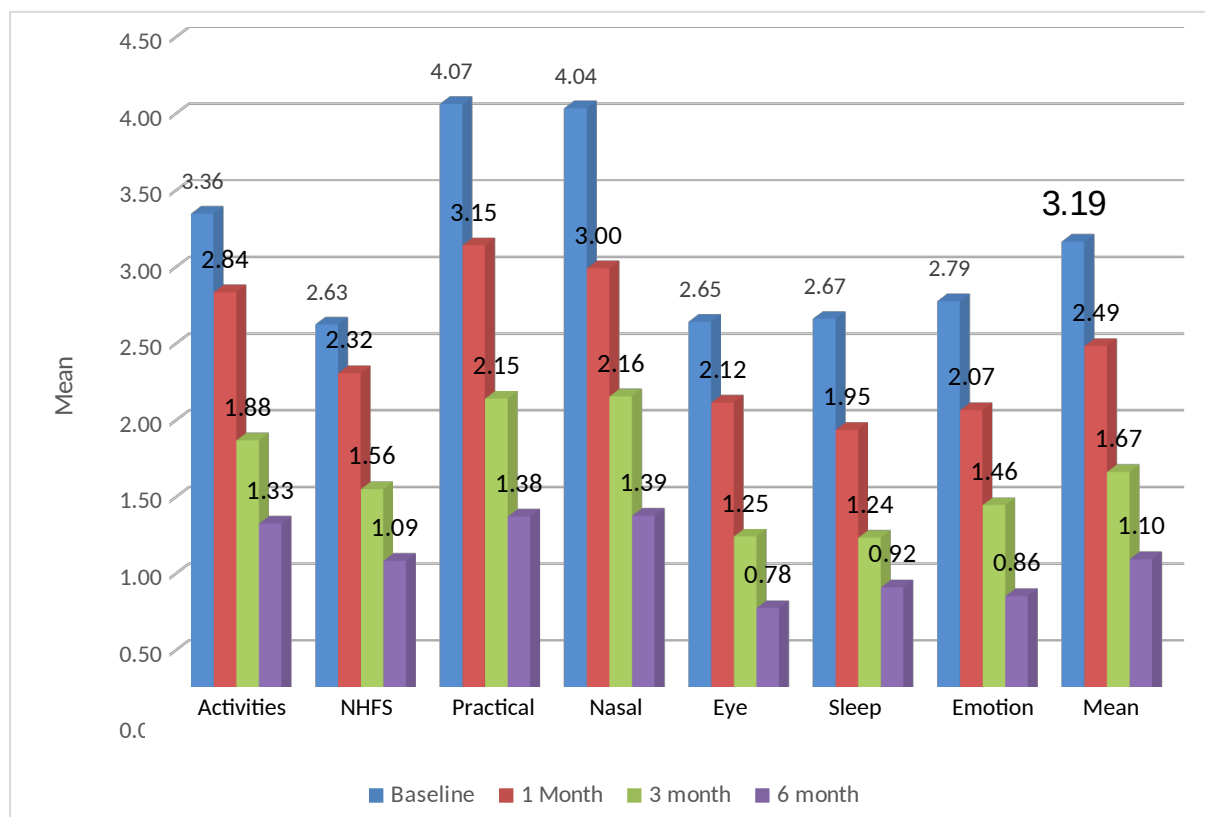

FIGURE 1 Based on the RQLQ, most of allergic rhinitis patient has their nasal symptoms and practical problem affected prior SLIT. All subsets of RQLQ showed significant during each followup in the first six months ($p < 0.05$).

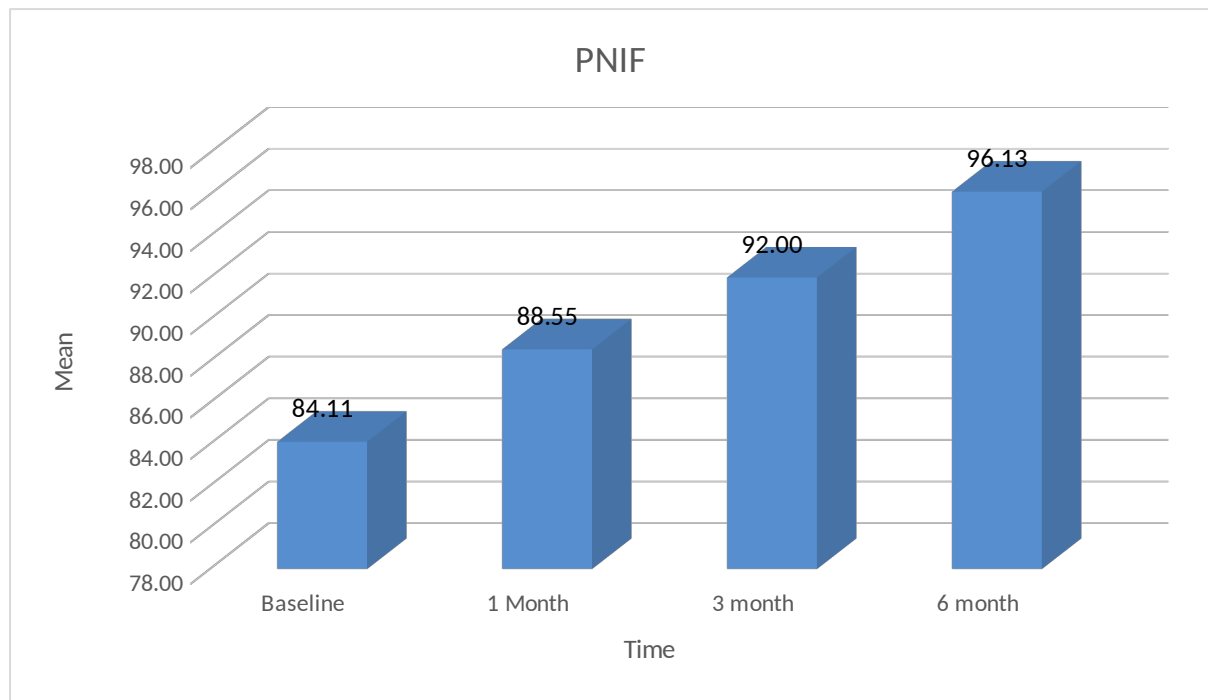

FIGURE 2 PNIF signifies functional parameters of the nasal cavity (nasal air flow and nasal decongestion). Significant improvement of PNIF is seen during each the followup ($p<0.05$).

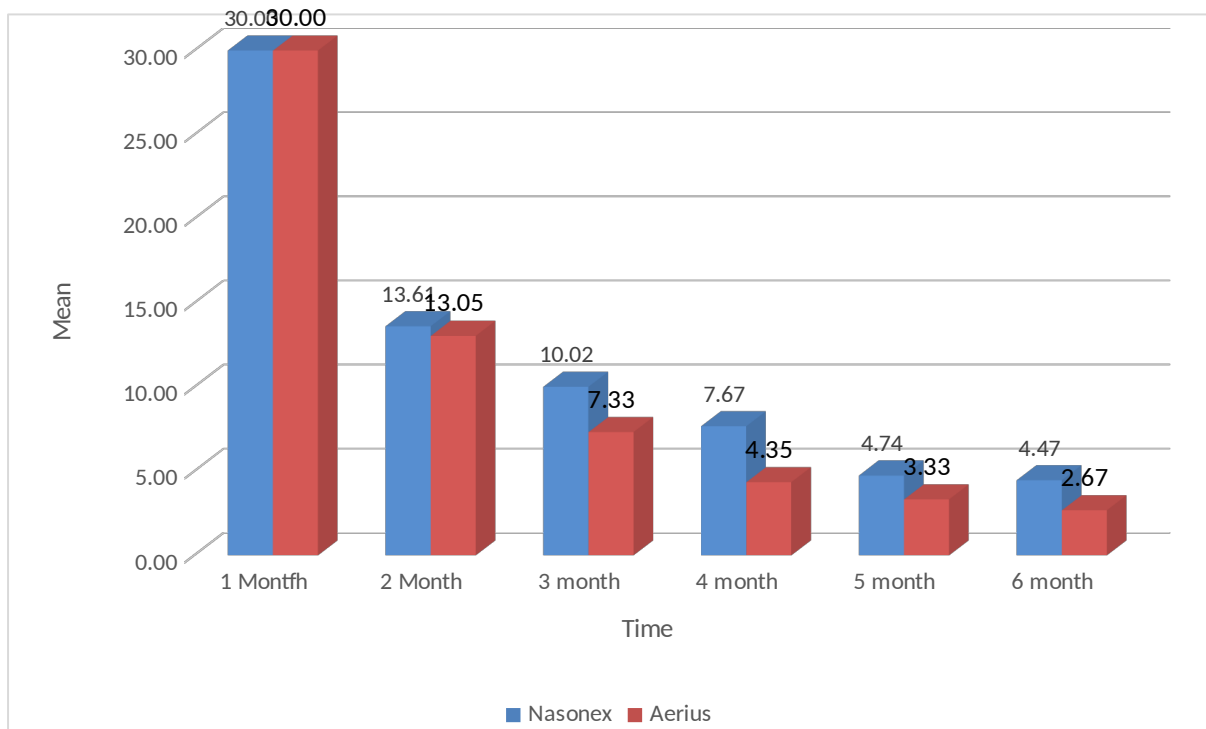

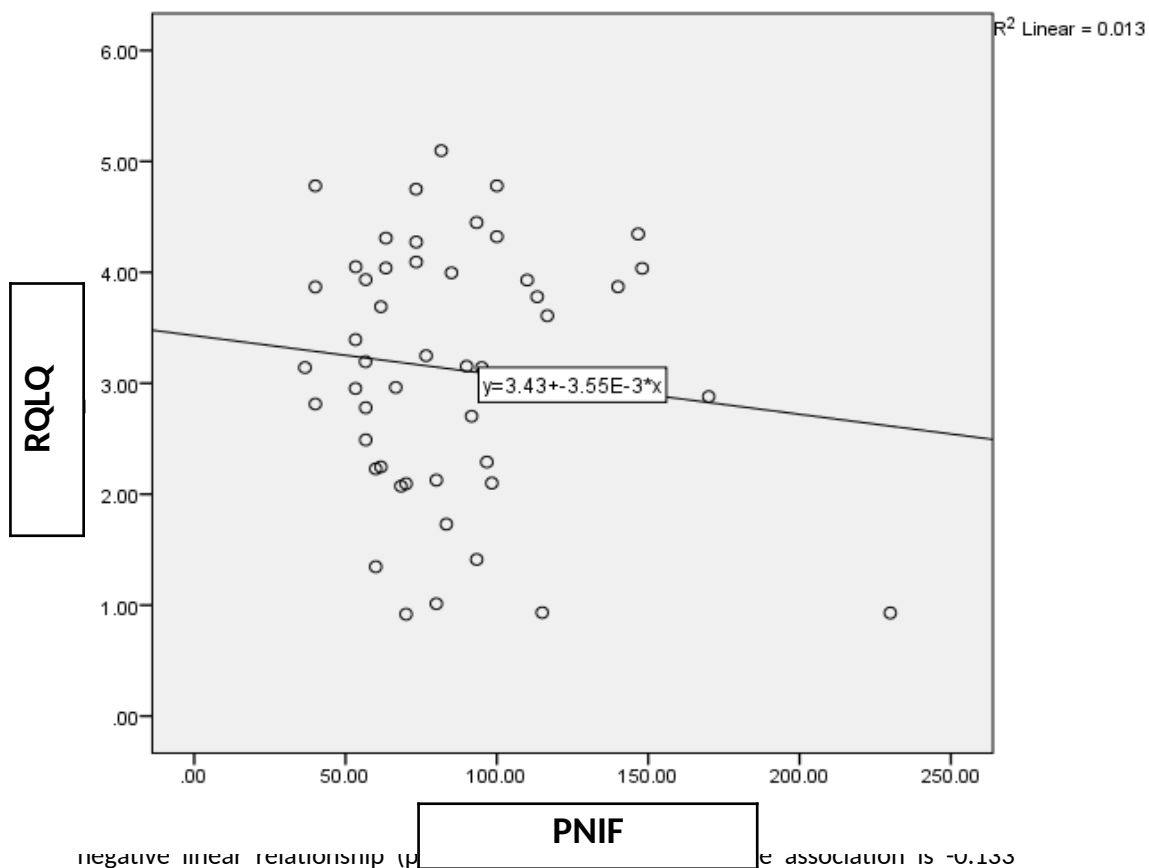

FIGURE 3 All of the patients were started on both Nasonex and Aerijs during the first month. Subsequent months, the medications are taken as rescue medication. At the end of six month, the mean usage for Nasonex and Aerijs are 4.47 and 2.67. There are statistically significant reduction of pharmacotherapy at six month ($p < 0.05$).

negative linear relationship (p-value association is -0.133 $(-0.1 < |r| < 0.3)$).
